

TAYLOR

Rig and Equipment LLC

The safety of your crew depends on the condition of the equipment. A Cat IV inspection provides piece of mind knowing the mast meets API recommended condition standards. A quality Cat IV inspection requires experienced inspectors with an eye for detail and knowledgeable welders and fabricators, skilled in the repair of hoisting structures.

Our People

The team at TRE brings more than 60 years of mast building and repair experience to the Cat IV inspection and repair process. All team members are AWS 1.D.1 certified and supervised by experienced industry experts. No other Cat IV provider has this depth of knowledge regarding mast design and construction, or the level of hands-on welding and fabrication experience to ensure repairs are done right.

Our Process

We have developed an efficient production system which breaks the recertification process down into daily objectives and milestones. This results in most Cat IV inspections taking between 6 and 8 weeks, depending on the extent of repairs.

This process ensures a high-quality inspection, cost effective repairs and a quick return back to the field.

What Sets Us Apart

- 60 years of combined mast design and construction experience.
- 6 to 8-week recertification process, depending on repairs required.
- Fully certified 1.D.1 fabricators, experienced with even the most complex repairs.
- A transparent process to maximize quality, control cost and ensure on time completion.
- Up-front pricing with no surprises at the end of the job.
